

Dev pools (MedQA/MMLU-Pro 200, GPQA 100, AQuA 254). Each point: SFT from S_1 on one round's labels only.
Hollow/filled pairs: labels collected by S_k vs G_k (after GRPO), placed beside chain round r_{k+1} (built from S_k's labels).
Small number next to a pair: $G_k - S_k$ accuracy. Bars: advisor calls per question (right axis).
Rounds: r1 = the static arm's data; r_k = labels re-collected by S_{k-1}. GPQA labels stop at r3.
